Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

**Description****BACKGROUND OF THE INVENTION**

5 This invention relates to the radiation curing of polymerizable coatings, such as is commercially practiced on many types of substrates. Radiation curing speeds up the application of coatings and generally requires the use of photoinitiators.

10 There are two principal types of such photoinitiators, cationic and free radical, which are selected depending upon the species of polymerizable materials used. For example, cationic photoinitiators are required by vinyl ethers and epoxy compounds, while free radical photoinitiators are employed with acrylates. When free radical photoinitiators are used, it is generally preferred to carry out the polymerization in an inert atmosphere such as nitrogen. Otherwise, the polymerization reaction is slowed by the presence of oxygen. Materials which are radiation cured with cationic photoinitiators need not avoid air and thus have an advantage over materials which require an inert atmosphere to be most efficiently cured.

15 In the past, where both types of polymerizable compounds have been used together, both types of photoinitiators have been included. For example, in U.S. Patent 4,156,035 mixtures of epoxy resins and acrylates are shown to be cured by radiation in the presence of both cationic and free radical photoinitiators. Dougherty and Vara in Rad Tech 90, North America, Conference Proceedings, confirmed this and reported on their experiments with mixtures of acrylates and vinyl ethers in which they employed both types of photoinitiators. They found that the use of cationic photoinitiators alone gave inferior results compared to mixtures of both types. More importantly, they found that free radical photoinitiators failed to provide sufficient curing when both acrylates and vinyl ethers were present.

20 In U.S. Patent 4,999,216 the patentees reported on a formulation which employed only free radical initiators with mixtures of vinyl ethers and maleate or fumarate esters which are known in the art to copolymerize. The coating formulation was intended for use on concrete floors and, as the patentees pointed out, cationic photoinitiators could not be used on a basic substrate since they involve the release of acid compounds. The assignee of the '216 patent stated in PCT/US90/01243 that vinyl ethers do not homopolymerize in the presence of free radical initiators and that they are therefore not replacements for (meth)acrylates.

25 Many of the radiation cured coatings in commercial use today include acrylate compounds and these are often blended with undesirable reactive diluents, such as N-vinyl pyrrolidone and acrylate monomers. Consequently, it is important to limit the use of such undesirable compounds and the substitution of vinyl ethers has been considered. Since vinyl ethers are radiation cured in the presence of cationic photoinitiators and acrylates are cured using free radical initiators, one might expect that mixtures of both types would be preferred. The present inventors have found that mixtures of multifunctional acrylates and vinyl ethers can be satisfactorily cured by radiation using only free radical photoinitiators, as will be seen in the discussion below.

30 EP-A-0155704 discloses photopolymerizable compositions comprising cyclic vinyl ethers (which are 3,4-dihydro-2H-pyranyl compounds) and urethane acrylates. The compositions are polymerized in the presence of combinations of cationic and free radical photoinitiators. WO-A-9 111 466 describes radiation curable compositions comprising an acrylate monomer or oligomer, a divinylether polyacetal oligomer and a cationic photoinitiator.

35 According to the present invention, there is provided a radiation curable coating composition comprising:

40 (a) multifunctional acrylate oligomers and monomers;  
 (b) vinyl ether monomers in amounts up to 35 equivalent % of the composition;  
 (c) an effective amount of a free radical photoinitiator and in the absence of a cationic photoinitiator.

45 Preferably the vinyl ether monomers comprise 0.5 to 20 equivalent percent of the composition.  
 The vinyl ether monomers may be defined by the formula

50 where

R' and R'' are monovalent radicals selected from the group consisting of H and alkyl groups having 1-10 carbon atoms

55 Z is a divalent radical having a molecular weight of about 28 to 250 and selected from the group consisting of alkylene, cycloalkylene or polyalkylene ether radicals

n is an integer from 1 to 4

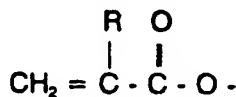

B is derived from aromatic and aliphatic hydrocarbons, esters, ethers, siloxanes, urethanes, and car-

EP 0 633 912 B1

bonates and has a molecular weight of about 60 to 400.

Acrylates may be defined generally as compounds which contain the group

5

10

where R is H or  $\text{CH}_3$

In the present invention, multifunctional acrylates are included in the coating composition in preference to monofunctional acrylates although some monofunctional acrylates could be present. The acrylates may be oligomers and/or monomers and preferred formulations include those containing urethane and epoxy oligomers.

15

The free radical photoinitiators preferably are acetophenone derivatives or benzoyl diaryl phosphine oxide derivatives.

DETAILED DESCRIPTION OF THE INVENTION

20

VINYL ETHER MONOMERS

The vinyl ether monomers may be generally described by the formula

25

where

30 R' and R" are monovalent radicals selected from the group consisting of H and alkyl groups having 1-10 carbon atoms

Z is a divalent radical having a molecular weight of about 28 to 250 and selected from the group consisting of alkylene, cycloalkylene or polyalkylene ether radicals

n is an integer from 1 to 4

35 B is derived from aromatic and aliphatic hydrocarbons, esters, ethers, siloxanes, urethanes, and carbonates and has a molecular weight of about 60 to 400

Monofunctional monomers are those which have n= 1, while the multifunctional monomers are those which have n=2 to 4.

40

Vinyl Ether Monomers from Esters

Vinyl ether terminated ester monomers may be described by the formula

45

50 where

n is 1 to 4,  
M<sub>1</sub> is a mono, di, tri, or tetra functional radical having a molecular weight of 15 to 180 and selected from the group consisting of alkylene, arylene, arakylene and cycloalkylene radicals,

55 Z is a divalent radical having a molecular weight of 28 to 250 and selected from the group consisting of alkylene, cycloalkylene, or polyalkylene ether radicals

R' and R" are monovalent radicals selected from the group consisting of H and alkyl groups having 1-10 carbon atoms

EP 0 633 912 B1

In one preferred embodiment  $M_1$  is a mono, di, tri, or tetra functional radical of benzene. In another embodiment,  $M_1$  is alkylene with 2-4 carbon atoms and Z is the  $\alpha, \alpha'$  diradical derived from 1,4-dimethylcyclohexane.

Vinyl Ether Monomers from Ethers

5

Vinyl ether terminated ether monomers may be obtained by reacting poly(ethyleneoxy), poly(propyleneoxy) or poly(butyleneoxy) glycols, i.e.,  $HO[-CH_2CH_2O]_mH$ ,  $HO[-CH(CH_3)CH_2O]_mH$ , or  $HO[-(CH_2)_4O]_mH$ , respectively, where m has an average value of about 1 to 5 with acetylene or a vinyloxyalkylhalide, for example, 2-chloroethyl vinyl ether. Transvinylation of the glycols with an alkyl vinyl ether may also be used.

10

Vinyl Ether Monomers From Aliphatic Hydrocarbons

15

Vinyl ether terminated aliphatic monomers may be described by the formula

where

20

$n$  is 1 to 4  
 $M_2$  is a mono, di, tri, or tetra functional aliphatic or cycloaliphatic radicals having a molecular weight of about 56 to 500  
Z is a divalent radical as defined above  
 $R'$  and  $R''$  are monovalent radicals as defined above

25

Vinyl Ether Monomers From Aromatic Hydrocarbons

30

Vinyl ether terminated aromatic monomers may be described by the formula

where

35

$n$  is 1 to 4  
 $M_3$  is a mono, di, tri, or tetrafunctional aromatic radical having a molecular weight of about 77 to 500  
Z is a divalent radical as defined above  
 $R'$  and  $R''$  are monovalent radicals as defined above

40

Vinyl Ether Monomers from Polysiloxanes

Vinyl ether terminated polysiloxane monomers may be described by the formula

45

where

50

$n$  is an integer from 2 to 8  
 $A$  is a polysiloxane having n Si-H groups and a molecular weight of 140 to 500  
 $R'$ ,  $R''$ , and Z are as defined above.

Vinyl Ether Monomers from Urethanes

55

Vinyl ether terminated urethane monomers may be described by the formula

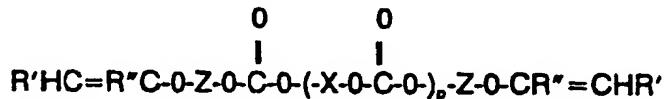

where

10  $M_4$  is a mono, di, or tri functional radical selected from the group consisting of alkylene, arylene, aralkylene, and cycloalkylene radicals  
 q is 1 to 3  
 R', R'', Z are as defined above

15 The monomers may also be derived from polyisocyanates, such as those described in U.S. Pat. No. 4,433,067. The term polyisocyanate also is intended to include quasi prepolymers of polyisocyanates where the polyisocyanate has been reacted with active hydrogen containing materials, such as polyols.

Vinyl Ether Monomers from Carbonates

20 Vinyl ether terminated carbonate monomers may be described by the formula

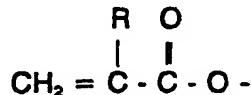

where

30 p is 0 to 3  
 R', R'', Z are as defined above  
 X is a diester, diol, or polyol moiety

Acrylates

35 Acrylates may be generally defined as compounds which contain the group

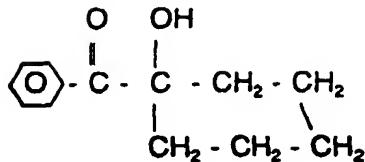

45 where R is H or  $CH_3$ . Typically acrylates may be oligomers and monomers and may include urethane and epoxy moieties. It has been found that monofunctional acrylates will not react adequately with vinyl ethers, as will be seen in the examples below. However, multifunctional acrylates can react with vinyl ethers until only a small amount of the monomers remain unreacted. Thus, in order that unreacted vinyl ethers may be minimized, multifunctional acrylate oligomers or monomers or both should be present, although monofunctional acrylates could be included to the extent that the end use of the composition permits. Multifunctional acrylates which have been found useful are employed in the examples below. However, other multifunctional acrylates are not excluded. Acrylates which contain acid moieties should be avoided since they may react with vinyl ethers.

Photoinitiators

55 Free radical photoinitiators known in the art may be used, particularly acetophenone derivatives and benzoyl diaryl phosphene oxide derivatives such as are discussed in U.S. Pat. No. 4,999,216.

One preferred photoinitiator used in the examples below is Irgacure 184, an acetophenone derivative supplied by

Ciba-Geigy and having the formula

10

In the examples about 3 pph (parts per hundred) of the photoinitiator is typically used, but more generally an effective amount of about 3 pph  $\pm$  2 pph of the composition may be employed depending on the film thickness. The selection of the photoinitiator and the degree of exposure to radiation will be determined experimentally for each formulation.

15

Formulation

20

It has been the intention of the present inventors to replace undesirable reactive diluents such as N-vinyl pyrrolidone in acrylate formulations. Since acrylates cure by a free radical mechanism, the substitution of vinyl ethers for N-vinyl pyrrolidone would be expected to be unsuccessful, since vinyl ethers are known to cure by a cationic mechanism. This is the conclusion stated by the patentees in U.S. Pat. No. 4,999,216. The present inventors have discovered that vinyl ethers may be used as reactive diluents in acrylate formulations which contain multifunctional acrylates.

25

In general, the amount of vinyl ethers included in the formulation will depend upon the maximum permissible unreacted vinyl ether in the cured film. Consequently, the vinyl ethers could be substituted for NVP or acrylate diluents to the extent that the particular application would accept unreacted diluents in the cured film. The maximum amount of vinyl ethers in the coating formulation may be up to about 30 equivalent %, but typically would be in the range of 0.5 to 20 equivalent %. The amount of vinyl ethers which can be included in the formulation will also be affected by the structure of the vinyl ethers used, since their reactivity will depend upon the structure. Thus, the vinyl ether monomers included in the formulas presented above will perform differently with respect to their reactivity with acrylates. One skilled in the art will understand that selection of specific vinyl ethers and the amounts used will be determined from experience with formulations with the boundaries described herein.

30

In Examples 1-3 which follow coating compositions were formulated using urethane-acrylate oligomers and epoxy-acrylate oligomers to demonstrate the advantages of replacing the presently used monomers with vinyl ethers. For example, replacing the monofunctional monomer N-vinyl pyrrolidine and the difunctional monomer hexanediol diacrylate with vinyl ethers. In each test the free radical photoinitiator Irgacure 184 (Ciba-Geigy) was used. All of the sample films were irradiated at 450 mJ/cm<sup>2</sup> with an RPC model QC-1202 ultraviolet processor using two medium pressure mercury arc lamps in a nitrogen atmosphere.

A group of 1.5 mil (0.038 mm) thick films were irradiated to cure and then extracted with methylene chloride in a Soxhlet extractor for 24 hours to determine the amount of unreacted monomers in the films.

35

Tensile testing was carried out on films coated onto glass plates with a 3 mil (0.076 mm) Byrd film applicator. The films were cured and then cut into 0.5" x 3" (12.7 x 76.2 mm) strips which were removed from the glass plate and tested in an Instron Model 4502 tester. The modulus was measured at 1% elongation according to ASTM D882.

Studies of the cure response were carried out using DuPont DSC, Model 910 and a DuPont DPC Model 930.

The Tg (glass transition temperature) was measured on 3 mil (0.076 mm) films which had been cured at 450 mJ/cm<sup>2</sup> using a Rheovibron Model DDV-II-C at 4 Hz.

40

The molecular weight distributions were determined using a Perkin-Elmer apparatus with a LC-30 RI detector. Ethyl acetate was used as a solvent and samples were passed through a series of columns as follows: 5 micron/50 A, 5 micron/500 A, and 10 micron/mixed bed.

Example 1

45

A series of formulations were prepared including 70 wt.% UV-893 (a urethane acrylate, Morton) and 15 wt.% of trimethylol propanetriethoxyacrylate (TMPTEA, Sartomer). The remaining 15 wt.% was N-vinyl pyrrolidone (NVP), 4-vinyl oxybutylbenzoate (HBZ), hexanediol diacrylate (HDDA), or bis(4-vinylxybutyl)succinate (VEX-4030, Allied-Signal). Three pph of Irgacure 184 was included. The four types of films were cured as described above and then evaluated for percent extractables, viscosity, tensile strength, elongation modulus, energy at break, Tg, induction time, peak time, percent reacted at peak, and mean and average molecular weight. The four formulations were designated A,B,C, and D. Their compositions are given in the table below as weight percent and in brackets, as equivalent percent.

EP 0 633 912 B1

Table A

Formulation	A	B	C	D
UV-893	70% (32.9)	70% (40.9)	70% (33.1)	70% (38.8)
TMPTEA	15% (27.8)	15% (34.5)	15% (28)	15% (32.8)
NVP	15% (39.3)	-	-	-
HBZ	-	15% (24.6)	-	-
HDDA	-	-	15% (38.9)	-
VEX-4030	-	-	-	15% (28.4)

5

10

15

20

The results of experiments to determine the extractable content of the cured films, that is, the amount of monomers remaining unreacted, are shown in the following table.

Table B

Formulation	% Extractables	% Monomer
A	3.16	0.16
B	3.84	0.84
C	3.17	0.17
D	3.56	0.56

25

30

The bulk of the extractables may be attributed to the photoinitiator. It can be concluded that both the acrylate diluents and the vinyl ethers have reacted with the urethane acrylate and the trifunctional TMPTEA.

Tests to evaluate the tensile strength of the cured films are given in the following table.

35

Table C

Formulation	Visc. @25%, mPa·s	Tensile Strength (psi) [kPa]	Elongation %	Modulus (psi) [mPa]	Energy at Break (lb-in) [kJ]
A	10,525	4481 [30,895]	15.3	202,000 [1,393]	2.9 [0.33]
B	22,275	2414 [16,444]	37.4	64,000 [441]	2.7 [0.31]
C	9,170	2591 [17,864]	43.2	48,400 [334]	2.9 [0.33]
D	22,400	2688 [18,532]	25.3	72,000 [496]	2.7 [0.31]

40

45

The viscosities of formulations B and D using vinyl ethers are higher than those of acrylate formulations A and C. It will be seen that tensile strength and modulus are altered when vinyl ethers are included. Thus, vinyl ethers can be used to achieve useful film properties.

The glass transition temperature (TG) for each formulation is shown in the following table.

55

EP 0 633 912 B1

Table D

Formulation	Tg, °C
A	78
B	44
C	37
D	54

5  
10

The cure response evaluation is reported in the following table.

Table E

Formulation	Induction Time, sec.	Peak Max (sec)	Reacted at Peak, %
A	0.9	2.8	21.9
B	0.9	2.8	20.7
C	0.8	2.4	20.8
D	0.8	2.4	19.4

15  
20  
25  
30

Both vinyl ether formulations B and D and conventional monomers A and C appear to react in a similar manner, however, since the reactivity ratio of the vinyl ether is much lower than that of the acrylate, the acrylate should have a propensity to homopolymerize. If crossover to vinyl ether does occur, the growing vinyl ether radical will rapidly cross-over to acrylate monomer. Thus, in the early stages of the vinyl ether/acrylate copolymerization, the polymer formed will be predominately acrylate based. In the latter stages of the polymerization, however, the acrylate becomes depleted relative to vinyl ether and formed during the latter stages of the reaction. Crossover to vinyl ether is enhanced. Conceptually, what is formed is a continuous polymer blend based upon the acrylate homopolymer formed in the beginning of the reaction and the acrylate/vinyl ether copolymers of varying composition. This is suggested by the data in the following table which shows that the amount of monomers reacted at a given time differs when vinyl ethers are present.

Table F

35  
40  
45

Formulation	Time, sec.			
	2	4	6	8
C	16	46	66	78
D	15	43	62	74

Example 2

50  
55

A series of formulations were prepared including 55 wt.% UV-893 (a urethane acrylate, Morton) and 30 wt.% of trimethylol propanetriethoxyacrylate (TMPTEA, Sartomer). The remaining 15 wt.% was hexanediol diacrylate (HDDA), bis(4-vinylxybutyl)succinate (VEX-4030, Allied-Signal) or hexanedioldivinylether (HDDVE). Again, 3 pph of Irgacure 184 was included. The three types of films were cured as described above and then evaluated for viscosity, tensile strength, elongation, modulus, and energy at break. The three formulations were designated E, F, and G. Their compositions are given in the table below, again as weight percent and in brackets, as equivalent percent.

EP 0 633 912 B1

Table G

Formulation	E	F	G
UV-893	55% (21.5)	55% (24.5)	55% (24.1)
TMPTEA	30% (46.3)	30% (52.7)	30% (51.9)
HDDA	15% (32.2)	-	-
VEX-4030	-	15% (22.8)	-
HDDVE	-	-	15% (24.0)

Tests to evaluate the tensile strength of the cured films are given in the following table.

Table H

Formulation	Visc. @25%, mPa·s	Tensile Strength (psi) [kPa]	Elongation %	Modulus (psi) [mPa]	Energy at Break (lb-in) [kJ]
E	2,250	2,300 [15,857]	27	65,000 [448]	1.6 [0.18]
F	4,810	4,000 [27,579]	16	146,500 [1,010]	2.1 [0.24]
G	1,650	3,400 [23,442]	12	132,000 [910]	0.9 [0.10]

Example 3

A second set of formulations was prepared but in this case using an epoxy acrylate CN 104 (Sartomer). The compositions are summarized in the following table as before. Three pph of Irgacure 184 was included.

Table I

Formulation	H	I	J	K
CN104	70% (55.2)	70% (63.5)	70% (55.5)	70% (61.5)
TMPTEA	15% (18.6)	15% (21.3)	15% (18.6)	15% (20.6)
NVP	15% (26.2)	-	-	-
HBZ	-	15% (15.2)	-	-
HDDA	-	-	15% (25.9)	-
VEX-4030	-	-	-	15% (17.9)

The tests described above and reported in Example 1 were carried out on the second set of formulations and the results are shown in the tables below, which correspond to the tables above.

The results of experiments to determine the extractable content of the cured films, that is, the amount of monomers remaining unreacted, are shown in the following table.

EP 0 633 912 B1

Table J

Formulation	% Extractables	% Monomer
E	6.4	3.4
F	7.4	4.4
G	5.9	2.9
H	5.7	2.7

10

Again, the vinyl ethers are shown to react with the acrylates using a free radical photoinitiator. Tests to evaluate the tensile strength of the cured films are given in the following table.

Table K

Formulation	Visc. @25%, mPa·s	Tensile Strength (psi) [kPa]	Elongation %	Modulus (psi) [mPa]	Energy at Break (lb-in) [kJ]
H	8,100	2,808 [19,360]	1.2	330,445 [2,278]	0.05 [0.0057]
I	14,000	2,464 [14,524]	1.6	294,026 [2,027]	0.06 [0.0068]
J	5,210	3,495 [24,097]	2.6	276,248 [1,904]	0.08 [0.009]
K	11,725	2,570 [17,719]	1.6	284,257 [1,960]	0.07 [0.0079]

Unlike the first example (Table C) the tensile properties with the vinyl ether compounds (I and K) are similar to those of the more conventional formulation (H and J). Thus the film's physical properties may be adjusted by proper selection of the reactive vinyl ethers.

The glass transition temperature (Tg) for each formulation is shown in the following table.

Table L

Formulation	Tg, °C
H	114
I	73
J	70
K	78

The cure response evaluation is reported in the following table.

Table M

Formulation	Induction Time, sec.	Peak Max (sec)	Reacted at Peak, %
H	0.9	2.6	19.5
I	0.8	2.4	19.1
J	0.8	2.4	20.4
K	0.8	2.6	21.0

35

Example 4

55

Comparative

Two formulations were prepared including 70 wt.% UV-893, 15 wt.% TMPTEA and 15 wt.% VEX-4030. For one

## EP 0 633 912 B1

sample (L) both a free radical photoinitiator (2 pph Irgacure 184) and a cationic photoinitiator (1 pph UVI-6990, Union Carbide) were used and for another sample (M) only the free radical photoinitiator was used, as in the examples above. The formulations were cured as described above and then evaluated for tensile strength, elongation, modulus and energy at break. The results are given in the following table.

5

Table N

10

Formulation	Tensile Strength (psi) [kPa]	Elongation %	Modulus (psi) [mPa]	Energy at Break (lb-in) [kJ]
L	2,110 [14,548]	38	71,700 [494]	3.3 [0.37]
M	3,500 [24,131]	30	19,000 [820]	3.1 [0.35]

15

It can be seen from the results that the polymers differ as a result of the difference in the type of photoinitiator. It would be expected that a homopolymer of vinyl ether was formed when a cationic photoinitiator was present (L), while this would not occur when only a free radical initiator was used according to the invention (M).

20

Example 5

25

Comparative

Two formulations were prepared using the monofunctional acrylate, benzyl acrylate (BA) and either N-vinyl pyrrolidone (NVP, Sample N) or 4-vinylxybutylbenzoate (HBZ, Sample O) and 3 pph Irgacure 184. The formulations were cured as described above but in this case no solid film was formed. The amount of unreacted monomers was determined by gel permeation chromatography (GPC). The results are shown in the following table.

30

Table O

35

Formulation	Composition	% Monomer Unreacted
N	15% equivalents NVP	0.4%
	85% equivalents BA	2.6%
O	15% equivalents HBZ	5.2%
	85% equivalents BA	7.9%

40

It can be seen that in the conventional acrylate composition N that all NVP was reacted and only 2.6% of the acrylate was unreacted. However, when the monovinyl ether (HBZ) was substituted, the amount of unreacted acrylate increased substantially and a significant quantity of the i vinyl ether also was unreacted.

Example 6

45

In contrast to the results of Example 5 the use of a multifunctional acrylate instead of the monofunctional acrylate (BA) gave quite different results. Varying amounts of trimethylol propanetriethoxy acrylate (TMPTEA) were mixed with bis(4-vinylxybutyl)succinate (VEX-4030) and 3 pph Irgacure 184. Cured films (1.5 mil or 0.038 mm) were again produced as described before and extracted with methylene chloride. The results are shown in the following table.

50

Table P

55

Formulation	Composition	% Monomer Extracted
P	15% equivalents 4030	0.1%
	85% equivalents TMPTEA	
Q	20% equivalents 4030	2.3%
	80% equivalents TMPTEA	

Table P (continued)

Formulation	Composition	% Monomer Extracted
R	25% equivalents 4030	
	75% equivalents TMPTEA	6.7%
S	40% equivalents 4030	7.9%
	60% equivalents TMPTEA	

10 It can be seen that the same ratio of the vinyl ether to the acrylate used in Example 5 produced in this test a much lower amount of unreacted monomers. Consequently, it may be concluded that the multifunctional acrylates permit including significantly more vinyl ether in the formulation than do monofunctional acrylates. It also may be concluded that there is an upper limit on the amount of vinyl ethers which can be included with the acrylates. Comparison of the 15 relative amounts of reactants based on the number of reactive equivalents is believed to provide suitable comparison.

## Claims

20 1. A radiation curable coating composition comprising

- multifunctional acrylate oligomers and monomers;
- vinyl ether monomers in amounts up to 35 equivalent % of the composition;
- an effective amount of a free radical photoinitiator and in the absence of a cationic photoinitiator.

25 2. The coating composition of Claim 1 wherein said vinyl ether monomers have the formula

30 where

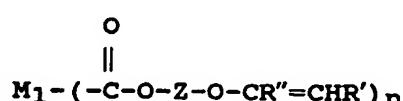

R' and R'' are monovalent radicals selected from the group consisting of H and alkyl groups having 1-10 carbon atoms

35 Z is a divalent radical having a molecular weight of about 28 to 250 and selected from the group consisting of alkylene, cycloalkylene or polyalkylene ether radicals

n is an integer from 1 to 4

40 B is derived from at least one member of the group consisting of aromatic and aliphatic hydrocarbons, esters, ethers, siloxanes, urethanes, and carbonates and has a molecular weight of about 60 to 400.

45 3. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from esters and having the formula

50 where

n is 1 to 4,

M<sub>1</sub> is a mono, di, tri, or tetra functional radical having a molecular weight of 15 to 180 and selected from the group consisting of alkylene, arylene, aralkylene and cycloalkylene radicals,

55 Z, R', and R'' are as defined in Claim 2

4. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from ethers by reacting at least one of the group consisting of poly(ethyleneoxy), poly(propyleneoxy), or poly(butyleneoxy) glycols, where m has

EP 0 633 912 B1

an average value from 1 to 5 with acetylene or a vinyl oxy alkyl halide.

5. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from aliphatic hydrocarbons described by the formula

5

where

10

n is 1 to 4  
M<sub>2</sub> is a mono, di, tri, or tetra functional aliphatic or cycloaliphatic radical having a molecular weight of about 56 to 500  
Z, R' and R'' are as defined in Claim 2

15

6. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from aromatic hydrocarbons described by the formula

20

where

25

n is 1 to 4  
M<sub>3</sub> is a mono, di, tri, or tetrafunctional aromatic radical having a molecular weight of about 77 to 500  
Z, R' and R'' are as defined in Claim 2

30

7. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from a polysiloxane defined as

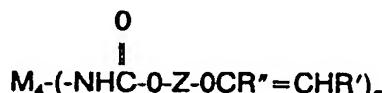

where

35

n is an integer from 2 to 8  
A is a polysiloxane having n Si-H groups and a molecular weight of 140 to 500  
R', R'', and Z are as defined in Claim 2.

40

8. The coating composition of Claim 2 wherein said vinyl ether monomers are (a) derived from a urethane defined as

where

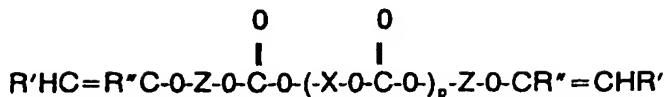

50

M<sub>4</sub> is a mono, di, or tri functional radical selected from the group consisting of alkylene, arylene, aralkylene and cycloalkylene radical  
q is 1 to 3  
R', R'', Z are as defined in Claim 2

55

or (b) a vinyl ether derived from a polyisocyanate.

9. The coating composition of Claim 2 wherein said vinyl ether monomers are derived from a carbonate defined as

where

$p$  is 0 to 3  
 $R'$ ,  $R''$ ,  $Z$  are as defined in Claim 2  
 $X$  is a diester, diol, or polyol moiety

10. The coating composition of Claim 1 wherein said free radical photoinitiator is an acetophenone derivative.
11. The coating composition of Claim 1 wherein the acrylate is a urethane acrylate oligomer or an epoxy acrylate oligomer.
12. The coating composition of Claim 1 wherein the vinyl ether monomers comprise about 0.5 to 20 equivalent percent of the composition.

## Patentansprüche

## 1. Strahlenhärtbares Beschichtungsmittel, enthaltend

- (a) multifunktionelle Acrylatoligomere und -monomere,
- (b) Vinylethermonomere in einer Menge von bis zu 35 Äquivalent-% des Mittels;
- (c) eine wirksame Menge eines radikalischen Photoinitiators und keinen kationischen Photoinitiator.

30 2. Beschichtungsmittel nach Anspruch 1, wobei die Vinylethermonomere die Formel

worin

R' und R" für monovalente Reste aus der Gruppe bestehend aus H und Alkylgruppen mit 1-10 Kohlenstoff-  
atomen stehen.

Z für einen zweiwertigen Rest mit einem Molekulargewicht von etwa 28 bis 250 aus der Gruppe bestehend aus Alkylen-, Cycloalkylen- und Polyalkylen-etherresten steht.

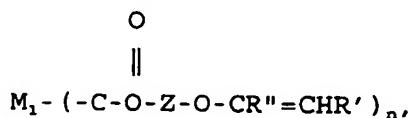

Besteht aus Ammonium + Cycloalkylion und eine ganze Zahl von 1 bis 4 bedeutet und

**B** von mindestens einem Mitglied der Gruppe bestehend aus aromatischen und aliphatischen Kohlenwasserstoffen, Estern, Ethern, Siloxanen, Urethanen und Carbonaten abgeleitet ist und ein Molekulargewicht von etwa 60 bis 400 aufweist,

haben.

### 3. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere von Estern abgeleitet sind und die Formel

50

worin

EP 0 633 912 B1

n für 1 bis 4 steht,  
M<sub>1</sub> für einen mono-, di-, tri- oder tetrafunktionellen Rest mit einem Molekulargewicht von 15 bis 180 aus der Gruppe bestehend aus Alkylen-, Arylen-, Aralkylen- und Cycloalkylenresten steht und

5 Z, R' und R<sup>\*</sup> die in Anspruch 2 angegebenen Bedeutungen haben,

haben.

10 4. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere durch Umsetzung von mindestens einem Mitglied der Gruppe bestehend aus Poly(ethylenoxy)-, Poly (propylenoxy) - oder Poly(butylenoxy) glykolen, worin m einen durchschnittlichen Wert von 1 bis 5 hat, mit einem Acetylen oder einem Vinyloxyalkylhalogenid von Ethern abgeleitet sind.

15 5. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere von aliphatischen Kohlenwasserstoffen der Formel

20 worin

n für 1 bis 4 steht,  
M<sub>2</sub> für einen mono-, di-, tri- oder tetrafunktionellen aliphatischen oder cycloaliphatischen Rest mit einem Molekulargewicht von etwa 56 bis 500 steht und

25 Z, R' und R<sup>\*</sup> die in Anspruch 2 angegebenen Bedeutungen haben,

abgeleitet sind.

30 6. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere von aromatischen Kohlenwasserstoffen der Formel

35 worin

n für 1 bis 4 steht,  
M<sub>3</sub> für einen mono-, di-, tri- oder tetrafunktionellen aromatischen Rest mit einem Molekulargewicht von etwa 77 bis 500 steht und

40 Z, R' und R<sup>\*</sup> die in Anspruch 2 angegebenen Bedeutungen haben,

abgeleitet sind.

45 7. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere von einem Polysiloxan der Formel

50 worin

n für eine ganze Zahl von 2 bis 8 steht,  
A für ein Polysiloxan mit n Si-H-Gruppen und einem Molekulargewicht von 140 bis 500 steht und

R', R<sup>\*</sup> und Z die in Anspruch 2 angegebenen Bedeutungen haben,

55 abgeleitet sind.

8. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere (a) von einem Urethan der Formel

O

||

worin

10  $M_4$  für einen mono-, di- oder trifunktionellen Rest aus der Gruppe bestehend aus Alkylen-, Arylen-,  
Aralkylen- und Cycloalkylenresten steht,

q für 1 bis 3 steht und

R', R" und Z die in Anspruch 2 angegebenen Bedeutungen haben,

15 abgeleitet sind  
oder (b) einen von einem Polyisocyanat abgeleiteten Vinylether darstellen.

9. Beschichtungsmittel nach Anspruch 2, wobei die Vinylethermonomere von einem Carbonat der Formel

20 O O

|| ||

25 worin

30 p für 0 bis 3 steht,

R', R" und Z die in Anspruch 2 angegebene Bedeutung haben und

X für eine Diester-, Diol- oder Polyol-gruppierung steht,

abgeleitet sind.

35 10. Beschichtungsmittel nach Anspruch 1, wobei es sich bei dem radikalischen Photoinitiator um ein Aceto-phenon-derivat handelt.

11. Beschichtungsmittel nach Anspruch 1, wobei es sich bei dem Acrylat um ein Urethanacrylat-Oligomer oder ein Epoxyacrylat-Oligomer handelt.

40 12. Beschichtungsmittel nach Anspruch 1, wobei die Vinylethermonomere etwa 0,5 bis 20 Äquivalentprozent des Mittels ausmachen.

Revendications

45

1. Composition de revêtement durcissable par un rayonnement comprenant:

(a) des oligomères et monomères acrylate multifonctionnels;

(b) des monomères éther vinylique en quantités allant jusqu'à 35% en équivalents de la composition;

50 (c) une quantité efficace d'un photoamorceur de radicaux libres et en l'absence de photoamorceur cationique.

2. Composition de revêtement selon la revendication 1, dans laquelle lesdits monomères éther vinylique répondent à la formule

55

dans laquelle

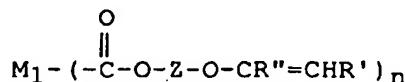

55 R' et R" sont des radicaux monovalents choisis dans le groupe constitué par H et les groupes alkyle comportant 1-10 atomes de carbone

5 Z est un radical divalent ayant une masse moléculaire d'environ 28 à 250 et choisi dans le groupe constitué par les radicaux alkylène, cycloalkylène ou poly(éther alkylène)

n est un nombre entier de 1 à 4

B est dérivé d'au moins un élément du groupe constitué par les hydrocarbures aromatiques et aliphatiques, les esters, les éthers, les siloxanes, les uréthanes et les carbonates, et possède une masse moléculaire d'environ 60 à 400.

10 3. composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'esters et répondent à la formule

dans laquelle

20 n a une valeur de 1 à 4,

M<sub>1</sub> est un radical mono-, di-, tri- ou tétra-fonctionnel ayant une masse moléculaire de 15 à 180 et choisi dans le groupe constitué par les radicaux alkylène, arylène, aralkylène et cycloalkylène, Z, R' et R" sont tels que définis dans la revendication 2.

25 4. Composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'éthers par la réaction d'au moins un des composés du groupe constitué par les poly(éthylèneoxy) -, poly(propylèneoxy)- ou poly(butylèneoxy)glycols, où m a une valeur moyenne de 1 à 5, avec l'acétylène ou un halogénure de vinyloxyalkyle.

30 5. composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'hydrocarbures aliphatiques décrits par la formule

35

dans laquelle

n a une valeur de 1 à 4,

40 M<sub>2</sub> est un radical aliphatique ou cycloaliphatique mono-, di-, tri- ou tétra-fonctionnel ayant une masse moléculaire d'environ 56 à 500,

Z, R' et R" sont tels que définis dans la revendication 2.

45 6. Composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'hydrocarbures aromatiques décrits par la formule

dans laquelle

50

n a une valeur de 1 à 4,

M<sub>3</sub> est un radical aromatique mono-, di-, tri- ou tétra-fonctionnel ayant une masse moléculaire d'environ 77 à 500,

Z, R' et R" sont tels que définis dans la revendication 2.

55

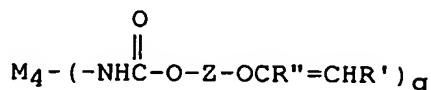

7. Composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'un polysiloxane défini par

(R'CH=CR"-O-Z-) <sub>n</sub>-A'

dans laquelle

5                   n                   a une valeur de 2 à 8,  
 A                   est un polysiloxane comportant n groupes Si-H et ayant une masse moléculaire de 140 à 500,  
 R', R" et Z       sont tels que définis dans la revendication 2.

10                8. Composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont (a) dérivés d'un uréthane défini par

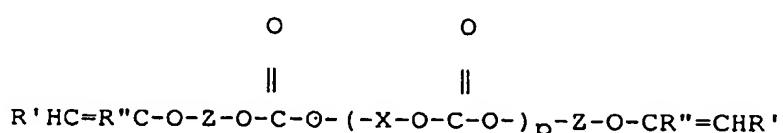

dans laquelle

20                M<sub>4</sub>                   est un radical mono-, di- ou tri-fonctionnel choisi dans le groupe constitué par les radicaux alkylène, arylène, aralkylène et cycloalkylène,  
 q                   a une valeur de 1 à 3,  
 R', R", Z        sont tels que définis dans la revendication 2,

25                ou (b) un éther vinylique dérivé d'un polyisocyanate.

30                9. Composition de revêtement selon la revendication 2, dans laquelle lesdits monomères éther vinylique sont dérivés d'un carbonate défini par

dans laquelle

40                p                   a une valeur de 0 à 3,  
 R', R", Z        sont tels que définis dans la revendication 2,  
 X                   est un groupement diester, diol ou polyol.

45                10. Composition de revêtement selon la revendication 1, dans laquelle ledit photoamorceur de radicaux libres est un dérivé d'acétophénone.

50                11. Composition de revêtement selon la revendication 1, dans laquelle l'acrylate est un oligomère d'acrylate d'uréthane ou un oligomère d'époxyacrylate.

55                12. Composition de revêtement selon la revendication 1, dans laquelle les monomères éther vinylique représentent environ 0,5 à 20 pour cent en équivalents de la composition.
